Filing Description:

Safeco Insurance Company of America 111-24740
Independent Homeowners Program
Rate and Rule Revision

Filing Number: 14-AR-S-HO-RR-HTP-PIBS
SERFF Number: LBPM-129629971

We are proposing the following revisions to our Arkansas Independent Homeowners Program that will result in a 5.9% overall rate change. The major elements of our filing are outlined below. Please note the impact of all changes is included in Evaluation of Change Exhibit.

This revision impacts new business effective on or after November 8th, 2014 and renewal business on or after January 16th, 2015.

We are submitting the Home, Condo, and Renters tiering models as confidential for your review. These models are trade secrets which Safeco has uniformly protected from public disclosure. It is Safeco's understanding that disclosure to your Department will not jeopardize their status as such.

The major elements of our filing are outlined below:

Homeowners:

Coverage Level Unity
Market Tier
Family Count
Protection Class
Policy Amount
Coverage B
Coverage C

Scheduled Personal Property
Newer Home Credit
Renewal Credit
Rate Stabilization

Homeowners (New Variables):

Condo:

Safeco does not offer a $500 flat deductible so all risks calculated in the homeowners survey form were calculated using a $1000 deductible for homeowners. Actual Cash Value was not used in the calculation in the home premium survey. Over 90% of in-force customers have full value personal property (FVPP), which is why we chose to apply the non-Actual Cash Value factor in the premium rate order calculation.

We appreciate your review of this filing and look forward to your timely approval. Please feel free to contact me with any questions or concerns.

Sincerely,

Sandy Jackson

Dear Becky Harrington,

Introduction:

Thank you for your correspondence of August 6, 2014. Below are our responses to the concerns raised.

Response 1

Comments:

Both variables have predictive power in our multivariate model. Since our indications were built from a multivariate model that includes all rating and tiering variables, the indications for each variable takes into account the impact of other variables, and there is no double-counting. Please refer to the Cov A & Cov A per Sq. Ft. exhibits which outlines indications and the proposed factors per variable.

Response 2

Comments:

The variable underwriting expense credit was originally introduced in 2009 (SERFF# LBRM-126148581) and has remained unchanged since. Because Essential policies incur lower commission expenses, we are able to discount them. Our latest data continues to support the 4.5% discount as shown in Exhibit VE, attached.

We are not proposing any changes to the variable underwriting expense credit with this filing. However, we believe that the previously submitted rate order calculation document may have misled the reader into believing it constituted a surcharge. Therefore, we have provided an amended sheet to the rate order calculation. The amended sheet features a negative sign in front of the variable underwriting premium factor to emphasize that it constitutes a price reduction rather than an increase.

Dear Becky Harrington,

Introduction:

Response 1

Comments:

We have amended the filing exhibits as requested to omit the use of the AIR CLASIC severe storm model. The revised provision for Tornado/Hail/Severe Thunderstorm Losses is based on the long term ratio of Safecos historical severe storm losses to amount of insurance (in thousands) in the state of Arkansas, including an annual trend factor. The resulting expected severe storm loss per $1,000 AOI from this analysis (1.747) is very similar to the provision estimated using the AIR CLASIC severe storm model (1.735). Please refer to the revised exhibit IV. The new rate indication is 14.3% (see revised exhibit I).

Tier relativities were selected to be a designated number of percentage points apart. The underwriting scores shown in Exhibit 5 of the scorecard filing were grouped so that the indication for each group matches the selected tier relativities. Upon renewal, the previously stabilized/capped premiums are used as a starting point to calculate the new rates. The premiums are then recalculated to take into account the new rates and the new exposures. The stabilization/capping factor is determined by the prior terms capped premium/the proposed uncapped premium. The proposed stabilization is applied to the updated uncapped premium.

Response 6

Comments:

The tables attached in the 'Objection 6 response tables' exhibit outlines the variables and drivers that offsets the base unity increase of 48.3%. Table 1 provides an aggregated view, whereas Table 2 provides more details about deriving the changes.

Protection Class factors, Coverage A, rate increase of 5.9%, and the inclusion of the new variables: Cov A per Sq. Ft, Roof Age and Roof Type are the relevant drivers and offsets the base unity by 45.8% The remaining 2.5% is the remaining variables used in rating and the multivariate impacts.

"Basic Premium" is defined as the premium charged for the coverages outlined in the Description of Coverage and Basic Coverage Limits sections for each form, after applying the appropriate deductible credit or debit. It does not include credits or debits for Increased Limits or Decreased Limits, Optional Coverages or Discounts.

However, the definition of Basic Premium for *Quality-Plus Homeowners Form 33* changes when Extended Dwelling Coverage and/or Full Value on Personal Property (Coverage C) are eliminated. Similarly, it changes when Full Value on Personal Property (Coverage C) is deleted for *Quality-Plus Condominium Form 88 and Renters Form 4*. In these cases only, Basic Premium will reflect the premium reduction associated with eliminating these coverages.

Temporary binder forms may not be used for binding homeowners insurance. New customers may be bound only by using an application form.

ARKANSAS INSURANCE DEPARTMENT

FORM H-1 HOMEOWNERS ABSTRACT

INSTRUCTIONS: All questions must be answered. If the answer is "none" or "not applicable", so state. If all questions are not answered, the filing will not be accepted for review by the Department. Use a separate abstract for each company if filing for a group. Subsequent homeowners rate/rule submissions that do not alter the information contained herein need not include this form.

Company Name Safeco Insurance Company of America
NAIC # (including group #) 111-24740

1. If you have had an insurance to value campaign during the experience filing period, describe the campaign and estimate its impact.
   We have used all the dwelling information that has been provided about each policy. If there was any missing data, MSB's database filled in the missing data based on address, original year of construction, construction style, number of stories, total living area, and dwelling type.

2. If you use a cost estimator (or some similar method) in order to make sure that dwellings (or contents) are insured at their value, state when this program was started in Arkansas and estimate its impact.
   We contract with the Marshall Swift Boeckh Co. (MSB) to estimate dwelling values for the purpose of making sure that they are insured 100% to replacement value. Use of MSB estimates is the prevailing method throughout the industry. MSB's Residential Component Technology (RCT) is used to estimate the value of the dwelling and the cost to replace it. We recently transitioned to MSB default/standard settings from customized settings since November 9th, 2013.

3. If you require a minimum relationship between the amount of insurance to be written and the replacement value of the dwelling (contents) in order to purchase insurance, describe the procedures that are used.
   Customers are required to have the dwelling insured 100% to value. Dwelling value is determined using the Marshall Swift Boeckh Co. Cost estimator as described above.

4. If you use an Inflation Guard form or similar type of coverage, describe the coverage(s) and estimate the impact.
   Effective November 9th, 2013, we will no longer run every policy through MSB's cost estimator (RCT) upon renewal to calculate the reconstruction costs. Instead, we will apply an inflation factor from the Coverage A inflation index to automatically calculate Cov A increases upon renewal. The inflation factors will be updated quarterly.

5. Specify the percentage given for credit or discounts for the following:

a.	Fire Extinguisher	0	%
b.	Burglar Alarm	2	%
c.	Smoke Alarm	0	%
d.	Insured who has both homeowners and auto with your company	17	%
e.	Deadbolt Locks	0	%
f.	Window or Door Locks	0	%
g.	Other (specify) Newer Home Credit	2-20	%
	Renewal Credit	1-2%	
	Umbrella Credit	2%	

Sprinkler Credit	4, 7%

6. Are there any areas in the State of Arkansas in which your company will not write homeowners insurance? If so, state the areas and explain reason for not writing.
   No

7. Specify the form(s) utilized in writing homeowners insurance. Indicate the Arkansas premium volume for each form.

Form	Premium Volume
Homeowners Form 30	$19,670,959
Condominium Form 85, 88	$140,519
Renters Form 4	$543,058

8. Do you write homeowner risks which have aluminum, steel or vinyl siding? ☒ Yes ☐ No

9. Is there a surcharge on risks with wood heat? No
   If yes, state the surcharge _____
   Does the surcharge apply to conventional fire places? No

Countrywide Profit Provision

As Safeco Insurance is organized under a mutual holding company system, our company has limited recourse to stock market capitalization to generate needed surplus funds, unlike a publicly-traded insurance company or an insurance company with a publicly-traded parent. Any increase in surplus must come from (1) underwriting profit, (2) investment income, (3) realized capital gains, or (4) unrealized capital gains. In the following analysis, Safeco selects provisions for underwriting profit which will ensure that anticipated income from all sources produces net income after taxes that is commensurate with the risk assumed in the business of property/casualty insurance. Furthermore, these provisions ensure that projected changes in policyholder surplus are sufficiently similar (in direction and magnitude) to changes in premium accounts so that confidence in the Companies' financial integrity can be maintained.

Exhibit A shows a history of calendar year rates of return for investment income expressed as a percentage of mean invested assets. The primary source is interest, dividends, and real estate income shown in column (3). Based on the current market yield, it is reasonable to anticipate before tax returns of 3.7% from interest, dividends, and real estate income during the time rates are effective. Historically, realized capital gains have contributed very little to earnings. For the prospective period, we select 0.2% from this source. In total, our anticipated pre-tax return is 3.9%. We believe this a reasonable return given the current interest rate environment. After federal income taxes, the total anticipated rate of return is 2.8% of invested assets.

Exhibit B presents the investment income derived from unearned premium reserves. The model uses historical information, modified for the current tax rate. This income is separated into two categories. First, there are premium finance charges [Line 10] collected by allowing policyholders to pay their premiums in installments over the 12-month policy term. Line 3 is the corresponding portion of the unearned premium reserve representing the premium which is being financed by the company. Second, there is the remaining reserve, after prepaid expense and taxes, [Line 7] which develops income based on the anticipated rate of return.

Exhibit C applies the rate of return to mean loss and loss adjustment expense reserves. These exhibits relate investment income to premium earned. Exhibit D provides pertinent expense data to calculate the Permissible Loss Ratio. Exhibit E deals with the calculation of federal income taxes applicable to unearned premium and loss reserves.

Income from all of the above sources is combined with our selected underwriting profit provisions in the following 1.25 to 1 premium-to-surplus model:

Let Premium = $100; Surplus = $80

Memo Exhibit

		Homeowners
1)	Investment Income on Unearned Premium Reserves $100 x (Exhibit B, Table 1, Item 12)	$1.46
2)	Investment Income on Loss Reserves $100 x (Exhibit C, Table 1, Item 5)	$0.58
3)	Investment Income on Surplus $80 x (Exhibit A, Table 1, Column 7)	$2.24
4)	Underwriting Income After Tax $100 x (1-.35) x Profit Provision (Exhibit D, Item 5b + Item 6)	$10.72
5)	Total Expected Return [1]+[2]+[3]+[4]	$15.00
6)	Expected Return on Surplus ([5]*Premium:Surplus Ratio)/100	18.8%
7)	GAAP Adjusted Return [6]/GAAP Adj. Factor (Exhibit F, Item 6)	15.0%

We have determined that, related to surplus, 15.0% is an appropriate and fair rate of return for property-casualty insurers in comparison with other industries, given the variability in the overall return. The pre-tax profit provision of 15.5% is derived using an iterative method to yield an anticipated return of 15.00% on earned premium after tax, and a 15.0% GAAP adjusted return on surplus. We have selected a target profit provision of 15.5% as a percentage of premium.

Safeco Insurance Companies
State of Arkansas
Actuarial Support

This product is based on the results of multiple multivariate statistical analyses. The analyses were performed on countrywide, all companies combined data. Indicated factors were calculated based on the best fit of the data using Generalized Linear Modeling (GLM). GLM was used to determine the predictiveness of each variable after removing the effects of all other variables, and the indicated relativities were generated for all variables simultaneously. The analyses were performed using EMBLEM, vendor software specifically designed to price personal lines insurance using GLM techniques.

The Safeco dataset comprised eight accident years (2005 – Sep 2012) of Safeco experience evaluated as of Sep 2012. In total the dataset contains more than five million earned house years. Modeled variables include various characteristics about the customer and property as well as a record of the losses actually experienced.

The Safeco dataset consists of two separate samples: 1) a training sample (80% random sample) used to fit statistical models, and 2) a validation sample used only after the completion of modeling in order to validate results "out of sample" (20% of total data).

Separate generalized linear models were fit to predict the frequency component (poisson error function) and the severity component (gamma error function), each using a log link function.

We sought the best fitting model for frequency and the best fitting model for severity. In searching for the best fitting models, consideration was given to predictiveness, credibility, and parsimony. AIC statistics were evaluated to determine if variables or interactions added significant predictive power to the model (if not, they were removed from the model) and adjustments were made to account for missing data. Standard errors were evaluated to determine if variable levels should be grouped.

We used the unseen 20% validation dataset to test the predictiveness of the model. The new program succeeded both in differentiating customers (it matched rate to risk) and in accurately forecasting loss (the predicted loss costs closely matched the actual loss costs). The model provides an actuarially sound rate for customers across the spectrum of loss potential.

GLM represents a well-accepted multivariate statistical analysis technique that simultaneously measures the impact of each predictive variable while controlling for the influences of all other predictive variables in the model. In this way, generalized linear models produce rating plans in which all rating variables receive their appropriate weights without any double counting. For further information on generalized linear models in the context of insurance ratemaking, we provide reference to the following source from the Casualty Actuarial Society's 2012 Exam 8 ("Advanced Ratemaking") syllabus: Anderson, et al., "A Practitioner's Guide to Generalized Linear Models," Third Edition, CAS Study Note, February 2007, available on the CAS web site (http://www.casact.org/library/studynotes/anderson9.pdf).

Credibility Standard
Dwelling Forms

The company endorses a conservative approach to Homeowners marketing, including pricing. To this end, we use a full credibility standard of 135,000 earned house-years in the experience period.

This standard is based upon the intent to have 95% confidence that the calculated value is within 10% of the true value of the statistic. According to Mahler and Dean's Foundations of Casualty Actuarial Science (fourth edition), a classical credibility approach can be used resulting in a standard for full credibility of the pure premium that can be expressed as

$$n_F = n_0 \times (1 + CV_S{}^2)$$

where

$$n_F = claims\ for\ full\ credibility,$$
$$n_0 = 384.16,$$

and

$$CV_S = coefficient\ of\ variation\ of\ the\ capped\ claim\ severity.$$

Using all Personal Insurance normal loss claims data combined, the best estimate of CVS 2.92. The resulting standard for full credibility is 3659 claims.

To translate this into an exposure standard, we reviewed our countrywide claim frequency figures excluding catastrophic claims for Personal Insurance Dwelling Forms. For the last four years, they show:

2009 2.82 claims/100 house-years
2010 2.69 claims/100 house-years
2011 2.71 claims/100 house-years
2012 2.6 claims/100 house-years

selected normal loss frequency:
2.7 claims/100 house-years

Dividing the claims necessary for full credibility by the experience claim frequency produces the house-years full standard.

For convenience sake, a full credibility standard of 135,000 house-years is used.

Summary of Rate Indications

Narrative

The most current rate level indication using all companies combined data for Arkansas Homeowners is +14.3% with a new business effective date of November 8, 2014 and a renewal business effective date of January 16, 2015.

Past and Prospective Experience Within and Outside the State

Calendar year earned premiums and accident year incurred losses are utilized in the indication. Five years of experience is used beginning January 1, 2009 and ending December 31, 2013. Losses are evaluated as of December 31, 2013. The Combined Dwelling forms rate level indication is +14.3% (See Exhibit I). This indication serves as justification for all forms, as our experience for Contents forms does not have significant credibility and, hence, is not reliable as an indicator of the adequacy of the company's current rates.

Direct earned premiums for the latest five calendar years are brought to current level by means of the parallelogram method. Premium is then adjusted to reflect changes in the amounts of insurance purchased due to inflation, shifts towards higher deductibles, changes in territory mix, etc. The calculation of the actual trend factors involves regression analysis on a state-specific basis of the latest five calendar years of average earned premium at current rate level (See Exhibit III).

Statewide total reported losses (excluding tornado/hail/severe storm/fire following losses and excluding catastrophes) capped at $250,000 per occurrence for the five accident years are developed to their ultimate value by use of loss development factors (See Exhibit II). The selected loss development factors are based on an analysis of Countrywide uncapped accident year losses evaluated at common ages and the patterns exhibited as these losses change from their initial valuation to final settlement. Capped Loss Factors are then applied to gross them up to their expected, uncapped level. These factors represent the estimated relativity of total losses to losses capped at $250,000 per occurrence (See Exhibit VII). Losses are then adjusted to reflect the impact of inflation of past claim costs.

A two-step trending procedure is used to project both premiums and losses. The historical trend factor brings data from the average date of each year used in the experience period to the average date in the latest experience period (July 1, 2013). The projected trend factor brings data from the average date in the latest experience period to one year beyond the proposed effective date (January 16, 2016). The loss trend selections are based upon a review of least squares fitted trend lines to the last five years of Industry Fast Track data and are shown in Exhibit III.

The data used to develop the indication is 55.0% credible, based on the full credibility standard of 135,000 earned exposures (See Exhibit VI). The product of Safeco's Southwest Region ex-catastrophe ex-severe storm pure premium and the number of Safeco's earned exposures in the state of Arkansas is used as the Loss Complement (See Exhibit I, Item 12a). The Trended and Developed Normal Losses are credibility weighted with the Loss Complement to determine the Credibility Adjusted Normal Losses (See Exhibit I, Item 12b).

The Weighted Normal Loss Ratio is the result of multiplying each year's Normal Loss Ratio by its respective weight and adding the products. This Loss Ratio is then projected to the future period via the premium and loss projection factors to arrive at the Projected Normal Loss Ratio (See Exhibit I, Item 20).

Catastrophic Hazards

Because of the low frequency and high severity nature of catastrophes, catastrophe losses could significantly impact the financial results of an insurer from one year to another. To properly reflect the catastrophe hazard, it is appropriate to eliminate actual catastrophe losses from the experience period and to include a catastrophe provision in the rates which represents expected catastrophic loss.

The Provision for Non-Modeled Catastrophes is for any expected catastrophic activity excluding hurricane, severe storm, and fire following earthquake. The factor is selected based upon the long term observed average ratio of Safeco's historical non-modeled catastrophe losses to amount of insurance (in thousands) in the state of Arkansas (See Exhibit IV).

The provision for Tornado/Hail/Severe Thunderstorm Wind Losses is based on the long term average trended ratio of Safeco's historical severe storm losses to amount of insurance (in thousands) in the state of Arkansas.

The provision for Fire Following Earthquake Losses is based on average annual fire following earthquake losses for Arkansas modeled from the AIR earthquake model.

These models are based on scientific data and mathematical and empirical models. Safeco's recent policyholder exposure information is used with the model to estimate the average annual loss. The provisions are the ratios of Safeco's expected annual loss to the most recent year's projected earned premium at current level (See Exhibit IV, Sheet 1), and are then added to the Projected Normal Loss Ratio (See Exhibit I).

Insurer Operating Expenses

Incurred losses are adjusted to include all loss adjustment expenses. Based on a 3-Year average of Safeco Arkansas loss adjustment expense factors, we have selected an LAE load of +11.7% (as a percentage of Earned Premium).

General and acquisition expenses are selected based on a 3-Year average of Safeco Arkansas expense projections (See Exhibit V). The total reinsurance cost to Safeco for Dwelling Forms was allocated to Arkansas based on the state's participation in all direct losses above $900 million CTE (Safeco's 2014 reinsurance treaty attachment point) Fixed expenses and reinsurance costs are then calculated as a percent of Earned Premium and added to the developed and trended loss ratio to determine the overall indicated loss, loss adjustment expense, fixed expense, and reinsurance ratio (See Exhibit I, Item 32). Safeco uses an annual trend of +1.8% to trend its fixed expense ratio.

Variable expenses include taxes, licenses, fees, profit and contingency, variable general and acquisition expenses. These items vary directly with premium (See Exhibit V).

The projected permissible loss, loss adjustment expense, fixed expense, and reinsurance ratio is +64.6% (See Exhibit I, Item 33).

Reasonable Profit Margin

Our selected margin of 16.6% for profit and contingencies is calculated to allow a return on surplus of 15%, with a 1.25:1 premium-to-surplus model (See Appendix A).

General Calculation Rules

Rounding Rule:

After each step of the premium computation, round to the nearest dollar ($.49 down, $.50 up). Round all each additional rates to the penny.

All premiums shown on the policy and endorsements shall be rounded to the nearest whole dollar. A premium of fifty cents ($.50) or more shall be rounded to the next highest whole dollar.

In the event of cancellation by the company, the return premium shall be calculated to the nearest cent.

Interpolation of Policy Amounts:

The premium for a policy amount (Coverage A) in excess of the minimum policy amount, not displayed in the policy amount relativity table, may be obtained by system rating. Coverage A limit interpolations shall be rounded to the nearest $100.

Basic Coverage Limit (% of Coverage A Limit)
50%

Coverage C: Relativites above the table amounts increase the Coverage C factor at a fixed rate for each 5% increase

The additional or reduced Coverage C is calculated by taking the percent of Coverage C to Coverage A (Cov C Limit / Cov A Limit). If that amount is the standard amount included in the policy (i.e. 50%), then there is no additional or reduced premium calculated. If the amount is not equal to the standard, then find the percent difference and use the tables to determine the factor used to adjust the base premium.

Example:

A Form 30 policy has Cov A Limit of $250,000 and Cov C Limit of $200,000. An adjustment is needed since 200,000/250,000 = 80%. Find the difference between 80% and 50%, 80% - 50% = 30%. Look at the Cov C factor table to find the
factor for 30% over and you get a 1.09 factor.

Additonal or Reduced Cov B Factor

Additional or Reduced Cov B is now calculated by taking the percent of Cov B to Cov A.
If that amount is the standard amount included in the policy (i.e. 10%),
then there is no additional or reduced premium calculated. If the amount is not the standards then find the percent difference and use the following lookup tables by form to determine the factor to use.

where

Γ is the gamma function,

$\Phi_{(\mu,\sigma)}$ is the cumulative distribution function of a normal random variable with mean μ and standard deviation σ,

$$e = \sum_{k=0}^{\infty} \frac{1}{k!},$$

π is the ratio of the circumference of a circle to its diameter,

and the inverse trigonometric functions shown return values between 90 and 270 (in degrees).

Summary of Rate Indications

Narrative

The most current rate level indication using all companies combined data for Arkansas Homeowners is +13.9% with a new business effective date of November 8, 2014 and a renewal business effective date of January 16, 2015.

Past and Prospective Experience Within and Outside the State

Calendar year earned premiums and accident year incurred losses are utilized in the indication. Five years of experience is used beginning January 1, 2009 and ending December 31, 2013. Losses are evaluated as of December 31, 2013. The Combined Dwelling forms rate level indication is +13.9% (See Exhibit I). This indication serves as justification for all forms, as our experience for Contents forms does not have significant credibility and, hence, is not reliable as an indicator of the adequacy of the company's current rates.

Direct earned premiums for the latest five calendar years are brought to current level by means of the parallelogram method. Premium is then adjusted to reflect changes in the amounts of insurance purchased due to inflation, shifts towards higher deductibles, changes in territory mix, etc. The calculation of the actual trend factors involves regression analysis on a state-specific basis of the latest five calendar years of average earned premium at current rate level (See Exhibit III).

Statewide total reported losses (excluding tornado/hail/severe storm/fire following losses and excluding catastrophes) capped at $250,000 per occurrence for the five accident years are developed to their ultimate value by use of loss development factors (See Exhibit II). The selected loss development factors are based on an analysis of Countrywide uncapped accident year losses evaluated at common ages and the patterns exhibited as these losses change from their initial valuation to final settlement. Capped Loss Factors are then applied to gross them up to their expected, uncapped level. These factors represent the estimated relativity of total losses to losses capped at $250,000 per occurrence (See Exhibit VII). Losses are then adjusted to reflect the impact of inflation of past claim costs.

A two-step trending procedure is used to project both premiums and losses. The historical trend factor brings data from the average date of each year used in the experience period to the average date in the latest experience period (July 1, 2013). The projected trend factor brings data from the average date in the latest experience period to one year beyond the proposed effective date (January 16, 2016). The loss trend selections are based upon a review of least squares fitted trend lines to the last five years of Industry Fast Track data and are shown in Exhibit III.

The data used to develop the indication is 55.0% credible, based on the full credibility standard of 135,000 earned exposures (See Exhibit VI). The product of Safeco's Southwest Region ex-catastrophe ex-severe storm pure premium and the number of Safeco's earned exposures in the state of Arkansas is used as the Loss Complement (See Exhibit I, Item 12a). The Trended and Developed Normal Losses are credibility weighted with the Loss Complement to determine the Credibility Adjusted Normal Losses (See Exhibit I, Item 12b).

The Weighted Normal Loss Ratio is the result of multiplying each year's Normal Loss Ratio by its respective weight and adding the products. This Loss Ratio is then projected to the future period via the premium and loss projection factors to arrive at the Projected Normal Loss Ratio (See Exhibit I, Item 20).

Catastrophic Hazards

Because of the low frequency and high severity nature of catastrophes, catastrophe losses could significantly impact the financial results of an insurer from one year to another. To properly reflect the catastrophe hazard, it is appropriate to eliminate actual catastrophe losses from the experience period and to include a catastrophe provision in the rates which represents expected catastrophic loss.

The Provision for Non-Modeled Catastrophes is for any expected catastrophic activity excluding hurricane, severe storm, and fire following earthquake. The factor is selected based upon the long term observed average ratio of Safeco's historical non-modeled catastrophe losses to amount of insurance (in thousands) in the state of Arkansas (See Exhibit IV).

The provision for Tornado/Hail/Severe Thunderstorm Wind Losses is based on the average annual severe storm losses for Arkansas modeled from the AIR CLASIC/2 v14.0 severe storm model.

The provision for Fire Following Earthquake Losses is based on average annual fire following earthquake losses for Arkansas modeled from the AIR earthquake model.

These models are based on scientific data and mathematical and empirical models. Safeco's recent policyholder exposure information is used with the model to estimate the average annual loss. The provisions are the ratios of Safeco's expected annual loss to the most recent year's projected earned premium at current level (See Exhibit IV, Sheet 1), and are then added to the Projected Normal Loss Ratio (See Exhibit I).

Insurer Operating Expenses

Incurred losses are adjusted to include all loss adjustment expenses. Based on a 3-Year average of Safeco Arkansas loss adjustment expense factors, we have selected an LAE load of +11.7% (as a percentage of Earned Premium).

General and acquisition expenses are selected based on a 3-Year average of Safeco Arkansas expense projections (See Exhibit V). The total reinsurance cost to Safeco for Dwelling Forms was allocated to Arkansas based on the state's participation in all direct losses above $900 million CTE (Safeco's 2014 reinsurance treaty attachment point) Fixed expenses and reinsurance costs are then calculated as a percent of Earned Premium and added to the developed and trended loss ratio to determine the overall indicated loss, loss adjustment expense, fixed expense, and reinsurance ratio (See Exhibit I, Item 32). Safeco uses an annual trend of +1.8% to trend its fixed expense ratio.

Variable expenses include taxes, licenses, fees, profit and contingency, variable general and acquisition expenses. These items vary directly with premium (See Exhibit V).

The projected permissible loss, loss adjustment expense, fixed expense, and reinsurance ratio is +64.6% (See Exhibit I, Item 33).

Reasonable Profit Margin

Our selected margin of 16.6% for profit and contingencies is calculated to allow a return on surplus of 15%, with a 1.25:1 premium-to-surplus model (See Appendix A).

Credibility Standard
Dwelling Forms

The company endorses a conservative approach to Homeowners marketing, including pricing. To this end, we use a full credibility standard of 135,000 earned house-years in the experience period.

This standard is based upon the intent to have 95% confidence that the calculated value is within 10% of the true value of the statistic. According to Mahler and Dean's Foundations of Casualty Actuarial Science (fourth edition), a classical credibility approach can be used resulting in a standard for full credibility of the pure premium that can be expressed as

$$n_F = n_0 \times (1 + CV_S{}^2)$$

where

$$n_F = claims\ for\ full\ credibility,$$
$$n_0 = 384.16,$$

and

$$CV_S = coefficient\ of\ variation\ of\ the\ capped\ claim\ severity.$$

Using all Personal Insurance normal loss claims data combined, the best estimate of CVS 2.92. The resulting standard for full credibility is 3659 claims.

To translate this into an exposure standard, we reviewed our countrywide claim frequency figures excluding catastrophic claims for Personal Insurance Dwelling Forms. For the last four years, they show:

2009 2.82 claims/100 house-years
2010 2.69 claims/100 house-years
2011 2.71 claims/100 house-years
2012 2.6 claims/100 house-years

selected normal loss frequency:
2.7 claims/100 house-years

Dividing the claims necessary for full credibility by the experience claim frequency produces the house-years full standard.

For convenience sake, a full credibility standard of 135,000 house-years is used.
